

Abstract

[Problem] A development type paper diaper which can be comfortably worn on a user.

[Means for Resolution] The development type paper diaper comprises a back sheet 12, a first absorbent 14, a second absorbent 15 and a liquid-permeable top sheet 11 in the recited order. The first absorbent 14 extends, when worn, from the back side 36 through the crotch 37 to the abdomen side 38 of the user. The second absorbent 15 extends, when worn, from the back side 36 to the crotch 37 of the user. A leakage preventing sheet 32 allowing no liquid permeation is interposed between the first absorbent 14 and the second absorbent 15. The second absorbent 15 leaves the first absorbent 14 from the crotch 37 to the back side 36 thereby to form a pocket PO for holding the excrement between the first absorbent 14 and the second absorbent 15. The leakage preventing sheet 32 is arranged to contact in the pocket PO with the second absorbent 15. The top sheet 11 is so conformed to the shape of the pocket PO as to cover the leakage preventing sheet 32.
